Canonical's Orange Box, the portable server cluster that the company intends to use to showcase OpenStack, MAAS, Juju and other aspects of the Ubuntu Linux-based cloud, is out. Here's what it's all about.

For starters, it's important to understand what the Orange Box is not: A revenue-generating hardware product from Canonical. The company has given no indication so far that it plans to sell these devices on a large scale?although if you truly want you can buy one, for the equivalent of around \$12,900, from TranquilPC Limited, the company that has the contract for manufacturing them.
