When we consider the Linux desktop, most often GNOME 3, Ubuntu Unity, KDE, Cinnamon, and XFCE come to mind. Those desktops range from the old-school functional to the new-school modern. Each has its strengths and weaknesses along with a vocal following to give it a push into the eyes of the public. For the most part, we use one of those desktops with little thought to making a switch. That's been my modus operandi for the longest time. Ubuntu Unity has been my desktop. I enjoy its combination of efficiency, powerhouse search, and modern flare.

But then along comes Linux Deepin, a distribution from China that looks to upturn the Linux desktop with an almost Apple-like sensibility. Linux Deepin offers a keen UI design that outshines most every desktop you've experienced. Along with that total redesign of the UI, comes a few bonus apps that might easily steal the show from most default apps.
