Black Lab Linux is a distribution designed for general desktop and power users that comes with a lot of applications and features. In the past, the developers tried to market this distribution as a replacement for Windows and Mac OS X systems and they even tried to make it look like those OSes.

It turns out that users didn't really go for that look, so the makers of Black Lab Linux had to change gears and make some important modifications. The current build of this Linux distribution looks very different from the previous editions, but that might turn out to be a good thing...
