Linus Torvalds has done another traditional Sunday afternoon development release of the Linux kernel. We're now just a few weeks out from seeing the release of Linux 3.16.

Released just a few minutes ago was Linux 3.16-rc4. Merged over the past week was just the usual assortment of bug/regression fixes with nothing too major standing out from my Git watching of the code; Linus has yet to send out his official 3.16-rc4 announcement with his few remarks. The 3.16 activity to point out though from the past week for Phoronix readers would be Radeon DRM going for BAPM by default.
