So 3.16 is has quite a few new features in terms of newly supported devices, also some what surprisingly this blog post will be out before 3.16! In terms of new device support all the SoCs listed here are exciting for a number of reasons for Fedora ARM. Aarch64 (ARM64) makes it?s first debut with support of real hardware although we?ve actually had kernel support enable for it for some time in Fedora even if only usable on the glacial Foundation emulator.

The 3.16 release is also very likely to be the kernel that ships with Fedora 21 GA and with the Alpha due in about a month we?re starting to polish and test all the platforms and devices we want to support for GA.
