It was an aging bespoke application that drove TransLink to seek a new content management system, but it was the strength of the community surrounding the open source project that helped the Queensland public transport agency choose Drupal.

Prior to the switch to Drupal, which began last year, the former TransLink site was partly based on static files and partly on a "home-grown CMS that managed a lot of our custom content such as service disruption and events, so that we could do a little bit of distributed authoring within the organisation," said Natalie Gorring, manager, online products and services, at TransLink.
