After more than a half-year in development and working on tens of thousands of lines of code, Pkg 1.3.0 has been released by FreeBSD developers.

Pkg 1.3.0 introduces a new solver to automatically handle conflicts and dynamically discover them, pkg install can now install local files and resolve their dependencies via remote repositories, sandboxing of the code has happened, improved portability of the code took place, the pkg API has been simplified, improvements to the multi-repository mode, and a ton of other changes and fixes took place.

More on the pkg 1.3.0 release for improved package management on FreeBSD can be found via this mailing list post.
