These days, that includes me. While I'm happy I have enough skills to usually fix a bug that made it past the developers at Mint or Fedora, I'd just as soon not have to deal with it. I have work to be done. And when I'm not working, I want to be wasting time with my friends on Facebook, not getting aggravated with my computer.

To be sure, Linux has changed with the times. In recent years you can pretty much be sure that when you install a major Linux distro on a laptop, Wi-Fi will work out of the box. Also, most of the time all you have to do is plug a new printer into a USB port and, presto!, it's already up and running. But there are still way too many little niggling problems that need to get fixed ? stuff that should have been fixed long ago.

Maybe if Ken keeps complaining enough?
