

How my uncle became a Linux user

It has been a month since my relatives from Bradford visited us here in Manchester. Our usual routine if they come to spend the holidays with us is to go to the gym to work out, to run on the treadmill and play pingpong. The best part of the workout, which we enjoy the most, is swimming afterwards. We get relaxed at the jacuzzi and then get hot and sweaty inside the sauna. It is a good exercise and offers relaxation after a stressful day of work. We have so much fun in the gym.

We arrived home around 8:00 pm after having a good round of walk in Manchester City Stadium. We were lucky to see the Manchester City football team; they had a match against Roma, so crowds were flooding in the streets. There were about a thousand spectators coming to watch the game who walked past us.

At home I prepared the meal. We had candlelights and red wine to enjoy while having our soup, vegetable salad and chicken for dinner; mango smoothies were the final dessert.

After the meal we chatted about the economy, healthcare, jobs, business, and technology in the U.K. I have learned a lot from Albert, my aunt's husband. He is an economist.

Albert explained to me that he was struggling with his PC. It was a brand new PC. It had a touchscreen and the laptop was thin and powerful. Albert's problem was not the laptop. As it turns out, his problem was Windows. The computer came with Windows 8. He already wasted a lot of money because shops exploited him. He did not even have an office suite installed. The computer was useless. He hardly used it. He hardly even had any files on it.

I then explained to Albert about GNU/Linux. I told him about Stallman and GNU. I also told him about the dirty tricks of Microsoft and about the true Bill Gates, including his involvement in GMO. Albert listened to me and he wanted to know more. I hope he learned something from me, just as I had learned from him.

The following morning I asked my husband for help. He was working all night and in the morning he was available to help Albert. Based on Roy's analysis, the machine was full of malware or some other mess. It was almost impossible to do anything with it. Windows 8 was hard to work with and it was hardly even possible to download and install a program like LibreOffice. The interface was confusing. It took ages to do very simple things.

Albert insisted that we should install GNU/Linux, but we didn't have a recent version of a distro at that time. Either way, Albert was so frustrated with Windows that he was willing to throw it all down the drain, along with his files.

This was my first time seeing Windows 8. I usually use Android or KDE. Microsoft Windows has become full of pop-ups, spam, marketing and other garbage. I am glad to use GNU/Linux and Albert will soon join us. By all means,

Albert now wants to use Open Source and he already learns how to use LibreOffice. [?](#)
