Ubuntu , SUSE , RedHat , Xandros and Linspire are doing a great job with Linux Desktop. But they've a long way to go, with more than 90% of Windows and around 5% of Apple only a small bite is left for them. However, the power of Linux is already proven in the server arena, currently it is powering many mission critical servers all around the world. It's free, it's reliable, it's rock-solid and most importantly it's open source. When I just started to work as an IT Engineer, I was a Windows guy. The word Unix/Linux used to scare me. Fortunately I was given a chance to learn and manage Linux Server in production environment. I was thrown into real life usage of Linux servers with live services like email, ftp, web and databases. From my experience I can say that it's not as scary as it seems in the beginning. With some minor efforts it can be learned by any Windows users and admins.

I've written this guide to help beginners who're interested in getting started with Linux. This should give you an overview of Linux and it's basic commands.
