Suppose you're a developer and want to experiment with Drupal 7.7 or WordPress. Maybe you're a K-12 teacher or university professor and want to teach your students Moodle administration or how to create some network-attached storage. You could download a tarball from Drupal.com or WordPress.org and configure on your own desktop or laptop, but then you would also need to configure Apache and MySQL too. All of these operations take effort and know-how that you may or may not have time for.
