If you are planning to purchase SSDs for Linux, keep an eye on the drives that are blacklisted by the Linux Kernel.

Also pay heed to what Sukar suggests, "...be careful, even when you don't enable the TRIM explicitly, at least since Ubuntu 14.04 the explicit FSTRIM runs in a cron once per week on all partitions ? the freeze of your storage for a couple of seconds will be your smallest problem."

If you pay attention to these points, your data may just stay in the solid state.
