Submitted by srlinuxx on Monday 2nd of May 2005 09:53:33 AM Filed under [Security](#) [1]

Highly critical

- Gentoo update for pound fixes a vulnerability, which potentially can be exploited by malicious people to compromise a vulnerable system.

- Mandriva update for xpm fixes a vulnerability, which potentially can be exploited by malicious people to compromise a vulnerable system.

[Link](#) [3]

Less critical

- Gentoo updates for horde, horde-vacation, horde-turba, horde-passwd, horde-nag, horde-mnemo, horde-kronolith, horde-imp, horde-accounts, horde-forwards and horde-chora. These fix a vulnerability, which can be exploited by malicious people to conduct cross-site scripting attacks.

[Link](#) [4]

- Gentoo: A security issue has been reported in phpmyadmin, which can be exploited by malicious, local users to disclose sensitive information.

The problem is that the file "[version]_create.sql" is left world-readable with the password for the pma user after the installation process.

Solution:

Change password for the MySQL pma user (see original advisory) and update to "dev-db/phpmyadmin-2.6.2-r1" or later.

- Mandriva update for perl fixes a vulnerability, which potentially can be exploited by malicious, local users to gain escalated privileges.

[Link](#) [6]

- Mandriva update for squid fixes two vulnerabilities, which can be exploited by malicious people to gain knowledge of sensitive information or cause a DoS (Denial of Service).
