☒

Linux has become a know how, if you are a system administrator working in a larger environment. Security teams have been deployed by large organizations to keep an eye on vulnerabilities in their systems and take corrective or preventive action as suitable.

In the recent times, many organizations have migrated from Windows, where everything is regulated with a point-and-click GUI. Thankfully, Linux has plenty of GUI tools that can help you keep away from the command line. Linux-based security tools and distributions can be used for penetration testing, reverse engineering, forensics and so on.
