As promised last year when the company introduced it, Pinterest today announced that it has released its Teletraan tool for deploying source code on GitHub under an open source Apache license.

?Teletraan is designed to do one thing, deploy code,? Pinterest software engineer Baogang Song wrote in a blog post. ?Not only does it support critical features such as zero downtime deploy, rollback, staging and continuous deploy, but it also has convenient features, such as displaying commit details, comparing different deploys, notifying deploy state changes through either email or chat room, displaying OpenTSDB metrics and more.?
