

Why Linux Distros Look Insecure Even Though They're Not

The Linux distro is also likely to tell you about bugs as soon as they are discovered instead of waiting for an arbitrary day like "Patch Humpday" or a press conference where they also announce some sort of positive news "Now includes NSA-supplied encryption back door for added security!" or some other new feature they're proud of.

When it comes to bugs, hacks, and security breaches, FOSS is typically "no waiting" when it comes to telling users about program flaws.
