We have recently stumbled upon a new project on GitHub, called GNOME Without Systemd, which promises to deliver a systemd-free experience of the GNOME desktop environment to Gentoo and Funtoo Linux users.

The GNOME Without Systemd project, which is, in fact, a collection of useful information on how to install GNOME without the systemd init system, saw its initial commit this past weekend, on April 16, 2016. You may want to know that it appears to have been put together by Dantrell B., a contributor to the Gentoo Linux and Gentoo Linux operating systems.
