For obvious safety reasons, most jurisdictions across the US and the world prohibit someone from driving a car if a video monitor is clearly visible from the driver?s seat. Hence why even though Tesla?s 17-in center display could certainly be capable of playing videos, the automaker disabled any video playing capabilities other than the video feed from the rear camera.

It didn?t stop a hacker who recently managed to install Gentoo, a Linux-based operating system, in her car and can now play videos directly from her Model S? 17-in display.

I am using ?her? here because the hacker is staying anonymous but goes by ?Hemera?, the Greek goddess of daytime.

Gentoo
