The Linux world keeps on turning and while I've been under the weather a KDE neon download scare rocked users recently as well as a newly discovered exploit in systemd. The exploit is said to "open the door to privilege escalation attacks, creating a means for hackers to root systems." Elsewhere, FOSS Force is running their annual Readers' Choice Awards Poll for the best Linux desktop distribution for the year ended a few weeks ago. Firefox 51.0 was released with a new logo and Arch is deprecating the 32-bit architecture images. Jamie Watson test several more distros on his new notebook and Jesse Smith reviewed GoboLinux saying, "I applaud the developers' efforts in making something unusual and interesting."
